

speedikon FM AG Releases New Version 2026.1 of Its C-Platform

*speedikon FM AG has released version 2026.1 of its CAFM platform **speedikon® C**, introducing a range of functional enhancements designed to simplify daily workflows and further improve efficiency in digital building, asset, and process management.*

Bensheim, Germany, 5 March 2026 – Software company speedikon FM AG has released version 2026.1 of its software platform **speedikon® C**, introducing a series of functional improvements and usability enhancements designed to support faster, clearer, and more efficient workflows. With this release, speedikon FM AG continues to develop its software platform to better support organizations in managing buildings, assets, and operational processes in an increasingly digital environment.

One of the central improvements of version 2026. is the redesigned start page, which now features accessible tiles. In addition, new standard command bars are planned for release in the autumn. These will provide a clearer structure and enable more intuitive navigation throughout the system. Newly preconfigured standard modules also make it easier for users to get started with key operational processes. These modules are designed to support common workflows and offer immediate practical value, for example in areas such as fleet management.

Another highlight of the new version is the introduction of new dashboards, primarily designed to provide a structured overview of key information. As view dashboards, they allow occasional users and management in particular to quickly access relevant KPIs, analyses, and status information. In certain standard modules, such as fleet management, dashboards can also be used in a limited interactive way. Depending on the user's role and permissions, certain functions can be executed directly, for instance canceling individual car bookings. These interactive dashboards require additional configuration so they can be tailored to each customer's specific processes.

The new version also introduces a dedicated Gantt module for visualizing time-based data. Orders, cost center allocations, and other process-related information can now be displayed along a clear timeline. This provides greater transparency for project planning, dependencies, and operational scheduling.

"Digitalization requires systems that combine powerful functionality with intuitive usability," says Adrian Merkel, CEO of speedikon FM AG. "With version 2026.1 of the C-Platform, we are further strengthening our solution to support organizations in managing complex building and asset data in a structured and efficient way."

To provide deeper insights into the new functionalities, speedikon FM AG also offers a webinar on demand where users can explore the new features and see practical examples of how the enhancements can be applied in real operational scenarios. [Get it here](#).

About speedikon FM

speedikon FM is a pioneering German software company that specializes in the digitalization of technical and commercial processes within buildings, data centers, and industrial plants. Since 1997, our company has been providing not just products, solutions, and technologies, but also a comprehensive range of services that empower our customers to optimize their asset-related business operations. Our team at speedikon FM possesses extensive expertise in handling vast amounts of data, complex databases, and seamless integration with existing software and hardware solutions.
